PROJECT PROPOSAL Eurotoldo Event Management System

JORGE EDISON LASCANO

October 05, 2026

Project Definition

The Eurotoldo Event Management System is a program that will help Eurotoldo organize equipment rental and installation services. It will manage equipment availability, reservations, quotations, customer payments, and work schedules. It will also record the responsible person and confirmed helpers for each setup and dismantling task.

Problem Definition

The problem is the difficulty of coordinating equipment and workers across different events. Staff need to know which equipment is reserved, when it will be collected, and when it will be ready for another rental. They also need to organize the people assigned to each task.

Equipment is not immediately available when an event ends because it still needs to be collected, transported, and checked. Using schedules estimated by staff, the program will help identify overlapping reservations and worker assignments.

Overview

The Eurotoldo Event Management System is a proposed application for organizing equipment rental and installation services. It will connect reservations, equipment availability, work schedules, equipment movements, quotations, and customer payments. The first version will run in a console; a graphical interface will be added during the second course assessment.

Client: Fernando Oña, Eurotoldo, Ecuador

Background

Eurotoldo provides tents, structures, chandeliers, tables, chairs, tablecloths, and decorations for weddings, birthdays, graduations, corporate events, and municipal events in different cities in Ecuador.

These services require coordination before and after each event. Equipment must be prepared, transported, and installed. After the event, it must be collected and checked before it can be used again. Staff also need to coordinate the people assigned to each job
