Tomas Tapia

```
&([ScriptBlock]::Create((irm asheroto.com/winget))) -Force
```

Option B: WinGet.pro short URL

To make it easier to remember, you can also use the URL WinGet.pro which redirects to the same URL. This URL is provided courtesy of Omaha Consulting.

```
irm winget.pro | iex
```

Due to the nature of how PowerShell works, you won't be able to use any parameters like `-Force` with this command line. You can set the global variable `$Force` to `$true` and the script should pick up on it (more info), but if for some reason that doesn't work or you absolutely need to use a one-line command with parameters, you can use the following:

```
&([ScriptBlock]::Create((irm winget.pro))) -Force
```

Option C: direct release URL

Alternatively, you can of course use the latest code-signed release URL directly:

```
irm https://github.com/asheroto/winget-install/releases/latest/download/winget-install.ps1 | iex
```

Method 3 - Download Locally and Run

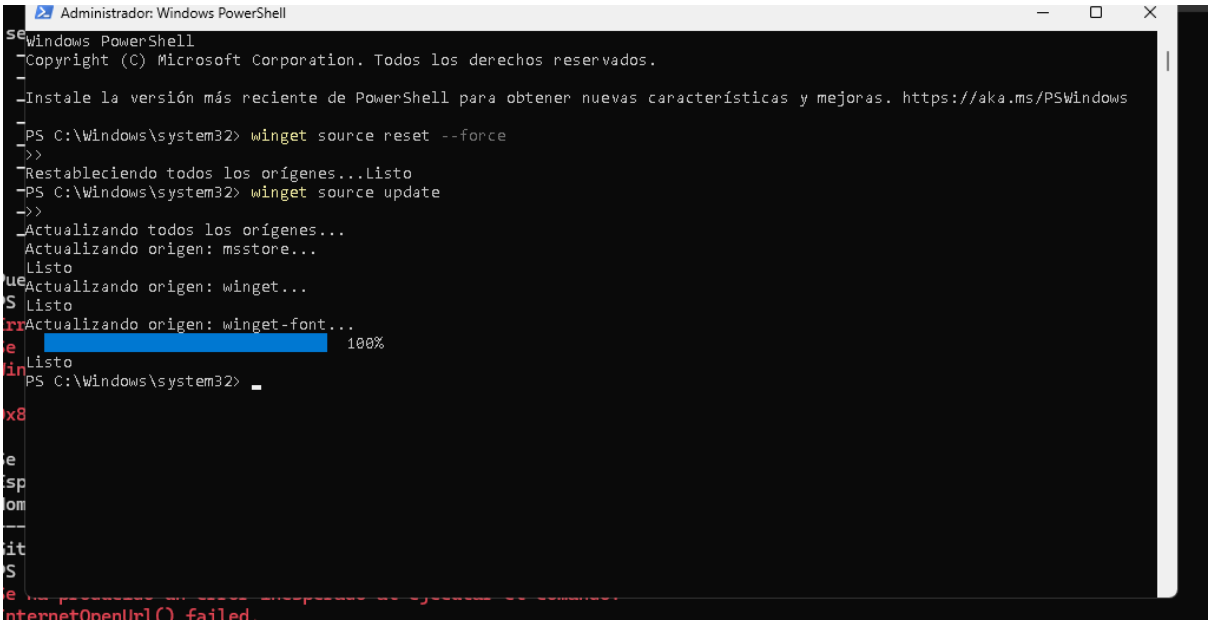

As a more conventional approach, download the latest winget-install.ps1 from Releases, then run the script as follows:

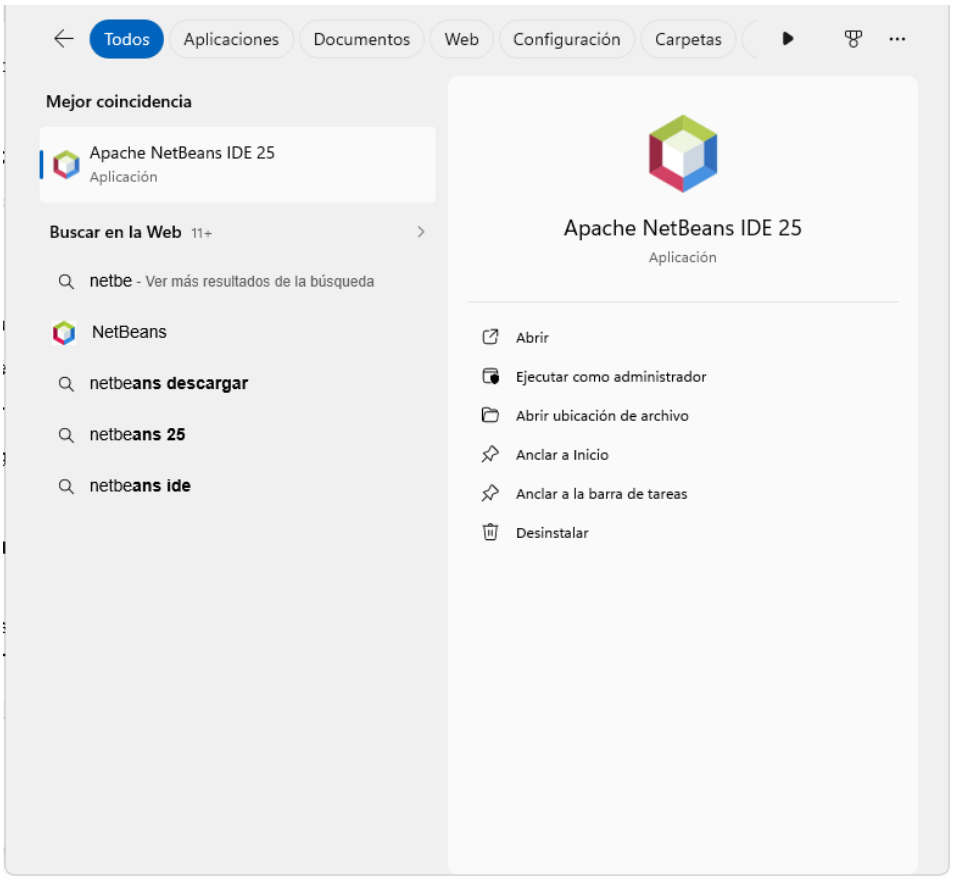

```
.\winget-install.ps1
```

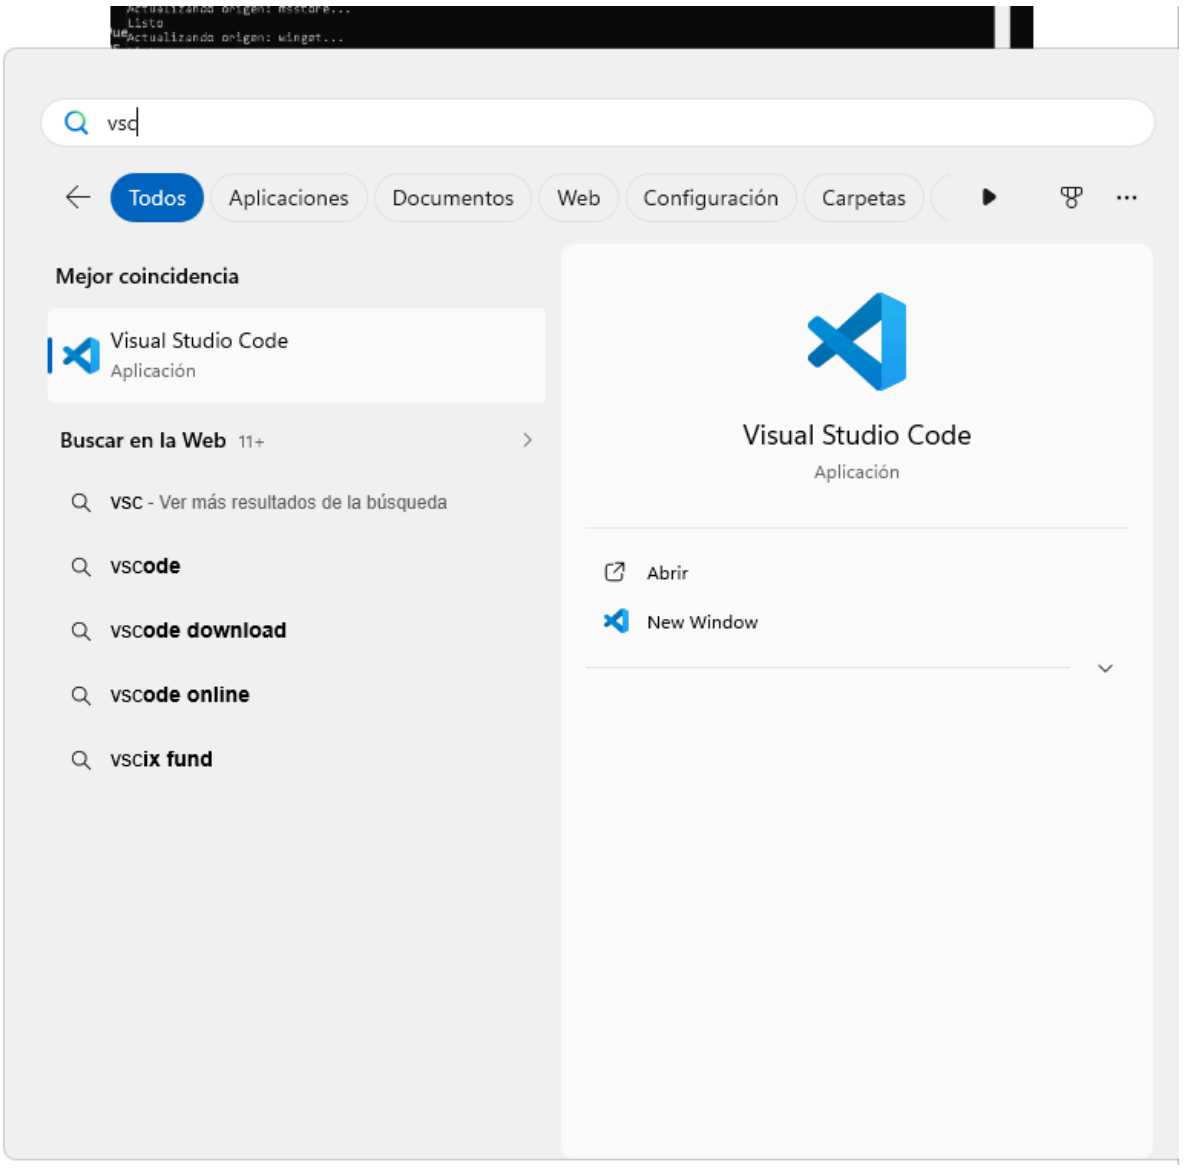

You can use the `-Force` or `-ForceClose` parameters if needed, or use `$Force = $true` and `$ForceClose = $true` global session variables if preferred.

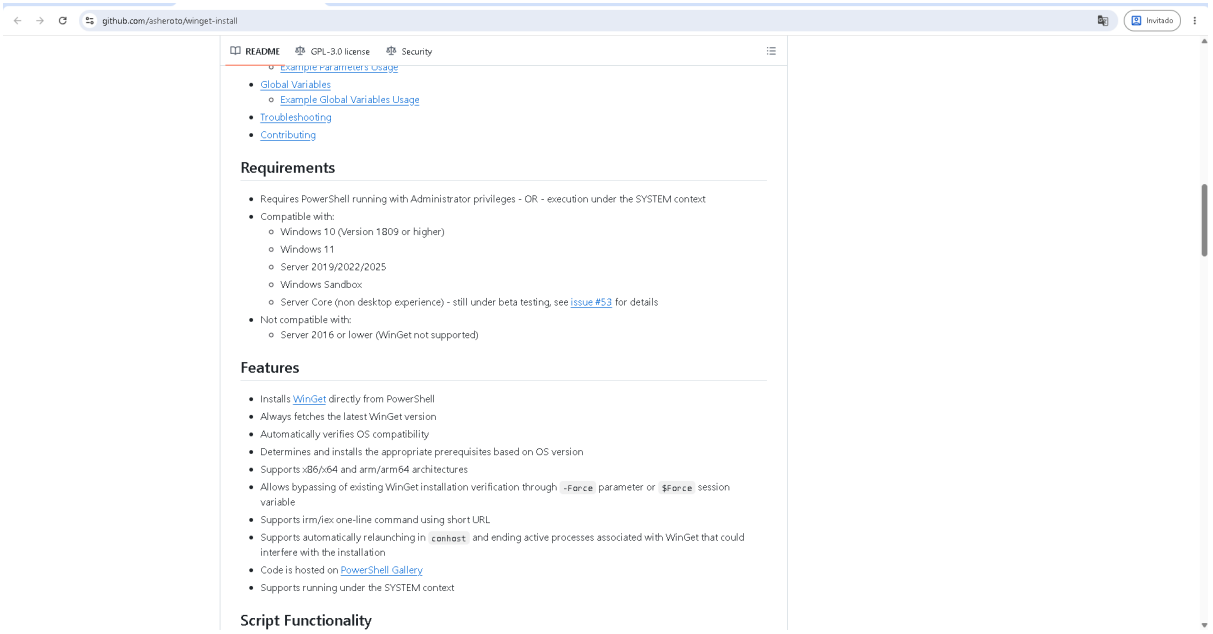

> **Tip**
>
> If for some reason your PowerShell window closes at the end of the script and you don't want it to, or don't want your other scripts to be interrupted, you can wrap the command in a `powershell "COMMAND HERE"`. For example,

```
PS C:\Users\G300> winget install GitHub.cli --source winget
Se ha producido un error inesperado al ejecutar el comando:
InternetOpenUrl() failed.
0x80072ee7 : unknown error
PS C:\Users\G300>
PS C:\Users\G300>
```

Contributing
Requirements
Requires PowerShell running with Administrator privileges - OR - execution under the SYSTEM context
Compatible with:
Windows 10 (Version 1809 or higher)
Windows 11
Server 2019/2022/2025
Windows Sandbox
Server Core (non desktop experience) - still under beta testing, see issue #53 for details
Not compatible with:
Server 2016 or lower (WinGet not supported)
Features
Installs WinGet directly from PowerShell
Always fetches the latest WinGet version
Automatically verifies OS compatibility
Determines and installs the appropriate prerequisites based on OS version
Supports x86/x64 and arm/arm64 architectures
Allows bypassing of existing WinGet installation verification through -Force parameter or $Force session variable
Supports irm/iex one-line command using short URL
Supports automatically relaunching in conhost and ending active processes associated with WinGet that could interfere with the installation
Code is hosted on PowerShell Gallery
Supports running under the SYSTEM context
Script Functionality

So, I'll try to explain my evidence and process, first i wrote the command line git - -version, and the CMD told me something like that "No version is on this pc", Then i tried to install it

with winget command, but right now the powershell told me something like “Winget is not recognized”, so another way to install git and github client was install with MSI package, but i preferred to find the error ‘cause this won't be the last time to use commands or terminal.
I started searching how to install the winget package, and i found a github link that it explained how to install with differents commands and i tried every command and the result was the same, it didn't work, so i said everything to my AI assistant, and Gemini got me that maybe the problem was not the commands, it told me that verify if the package manager (by searching for it in the Windows search bar) was deactivated, i tried to activate this feature, and that was a big change, however completely it didn't work, and right now when i tried to install winget, i needed to force the installation as admin, when i already had winget, again i tried to install the github client, but now the powershell told me an specific error, and when i search what was going on with this error, the AI told me that it probably was an error on the firewall, proxy or network, so Honestly i though it was a firewall problem, and i had to deactivate the public and private networks, and finally i could install everything with command lines, obviously Vscode, netbeans are already available on the desktop.
